Another Level? — Bryson Stott, 2026

Season recap · 2B/3B, bats left · Philadelphia Phillies · 608 PA in 155 games · data through 2026-10-01

Prepared for: Front office, player development, hitting and infield coaches

2026: .256/.334/.401 · wOBA .325 · xwOBA .330 · BB 10.2% · K 16.4% · chase 30.0%

Governance: Use Case #55 (`uc-pos-020`) · build `dp_uc55` v1.0.0 · kernel `dp_uc55_kernel.py` imports `dp_uc54_kernel.py` (sha256 `1a31b30a…`) and `dp_uc40a_kernel.py` (`807986c0…`), with 14 pins in all. New objects ER-1, GS-1 and IO-1 are provisional; ER-1 and GS-1 were registered in the BID before any era split was computed. Independently verified; see `05_quality_certification.md`.

Companion: `dp_uc55_stott_2026_dashboard.html`, the same story in 7 chapters.

Read this first: data window, sources, carry-ins.

- **Entity lock:** MLBAM 681082 with the Phillies batting role (fielder_4 / fielder_5 on defense), never a name filter. Regular season for every rate, 2022-26; 608 PA in 2026 across 155 games (2026-03-26 to 2026-09-27).
- **Your notebook's frame** (`pos[pos.player_name == pn]`) has no game-type filter: it carries 182 non-regular PA across 2022-26, including 37 spring-training and 3 exhibition PA in 2026 (SRC-4). Section 8 grades your claims on your frame first, then on the governed one.
- **Postseason** is a ledger line, never a rate: 2026 Wild Card 13 PA, 2 hits.
- **Carry-ins (quoted, never computed on):** CI-1 2026 line .256, 10 HR, 62 BB (thatballsouttahere, 10/22) · CI-2 2B 2026 +8 OAA / −9 DRS in 953⅓ inn; 2025 second half .294 / .855 OPS after a stance change under Kevin Long; Dombrowski: "I don't know why he can't be that player all the time" (On Pattison, 10/18) · CI-3 moved to 3B after the Arraez trade: +2 OAA / +3 DRS in 129 inn; "not … a third baseman for the long term" (Inquirer / Central Bucks News, 8/19-20) · CI-4 career 2B +33 OAA / +8 DRS · CI-5 Bohm in his final contract year (NBC Sports Philadelphia, 5/6).
- **Bat path** ships from 2025 and bat speed from 2024 (NULL before, never imputed). In this data plane `attack_direction` is **pull-negative** and stand-normalised (O-15, re-proven at build); the report flips it so pull reads positive.
- **Defense is a proxy.** IO-1 scores ground balls against similar grounders; the log has no starting position, range, arm or catch data. OAA and DRS appear beside it as carry-ins, never blended.

1 · Bottom line: another level?

1. **2026 was his best season, and it wasn't a fluke.** .256/.334/.401, a .325 wOBA and .330 xwOBA, both career highs, with career-best walk (10.2%), hard-hit (37.5%) and barrel (5.6%) rates. His xwOBA has risen in every season of his career: .280 → .303 → .309 → .319 → .330.
2. **The "good eras" are mostly noise.** ER-1 looked for a real change point in every season and found none on wOBA. Your three hand-set eras don't clear a hindsight-corrected test either (p 1.00 / 0.77 / 0.59). The early-2023 era wasn't even better by wOBA (.319 vs .330); it was a BABIP run.
3. **You were right that he's the same hitter in good and bad stretches** (GS-1: same hitter, results ran ahead). The exception is summer 2026: walks (7.6% → 12.5%) and xwOBA (.312 → .346) really moved. So did luck: BABIP went .245 → .346.
4. **The real level-up already happened, and it was mechanical, not seasonal.** After the 2025 stance change he met the ball 25.7 → 29.3 → 31.8 inches further out front, and his swing turned toward the pull side. He pulled 49.1% of his balls in play in 2026 (a career high) and went the other way 26.5% (a career low). So, no, he isn't using all fields; the pull is what's working.
5. **The level left is the zone, not more power.** 2026 was his worst chase season (30.0%; 23.3% in 2025) and his worst whiff season (18.7%). His best month, August (.370 wOBA, 17.2% walks), came with his lowest chase (24.0%). Bat speed ranks 10th of 12 Phillies hitters, so extra slug is not the easy lever.
6. **Defense:** by the IO-1 proxy, second base was a down year (-9 outs after +12 / +13 / +19), in line with the −9 DRS carry-in and against the +8 OAA. Third base (82 chances) is too small and unstable to settle a move. Moving him there puts Arraez's bat in Bohm's place (ISO .090 vs .133): your "limited thump" worry holds.

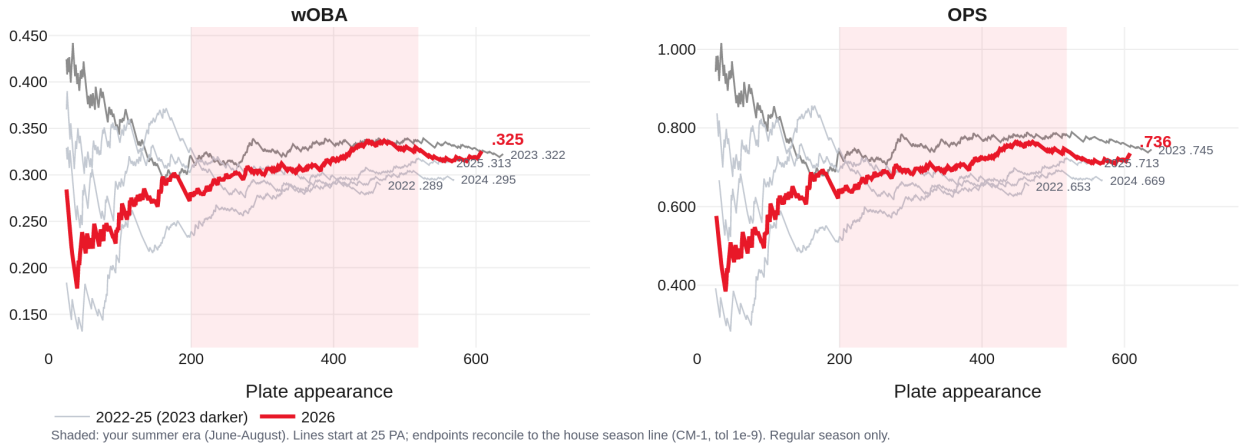

2 · The 2026 line (Q1, Q7)

He started cold: 2026 ranked 4th of his five seasons in cumulative wOBA at 200 PA (.280) and still 2nd at 400 PA, then finished 1st (.325). OPS finished 2nd (.736) because 2023 kept more slugging (.419 vs .401). On the house panel 2026 is his best xwOBA, best walk rate and best barrel rate, and his 5th-best chase rate of five (the worst). Against 220 Phillies hitter-seasons since 2015, the 2026 xwOBA beats 73%.

Season	PA	AVG/OBP/SLG	wOBA	xwOBA	BB%	K%	Chase	Whiff	Hard-hit	Barrel	LD%
2022	466	.234/.295/.358	.289	.280	7.7%	19.1%	28.2%	17.2%	36.8%	4.4%	21.2%
2023	638	.280/.327/.419	.322	.303	5.8%	15.7%	29.5%	15.3%	35.2%	4.7%	25.3%
2024	569	.245/.313/.356	.295	.309	9.0%	16.3%	28.3%	17.0%	30.8%	3.6%	23.7%
2025	562	.255/.325/.388	.313	.319	9.4%	16.2%	23.3%	16.7%	29.5%	5.1%	23.7%
2026	608	.256/.334/.401	.325	.330	10.2%	16.4%	30.0%	18.7%	37.5%	5.6%	24.8%

A slow start, then his best season: .325 wOBA, .736 OPS

Cumulative by plate appearance, 2026 against his own 2022-25 seasons. At 200 PA 2026 ranked 4th of 5 in wOBA (.280); by 400 PA 2nd; it finished 1st. OPS finished 2nd (2023 keeps the slugging).

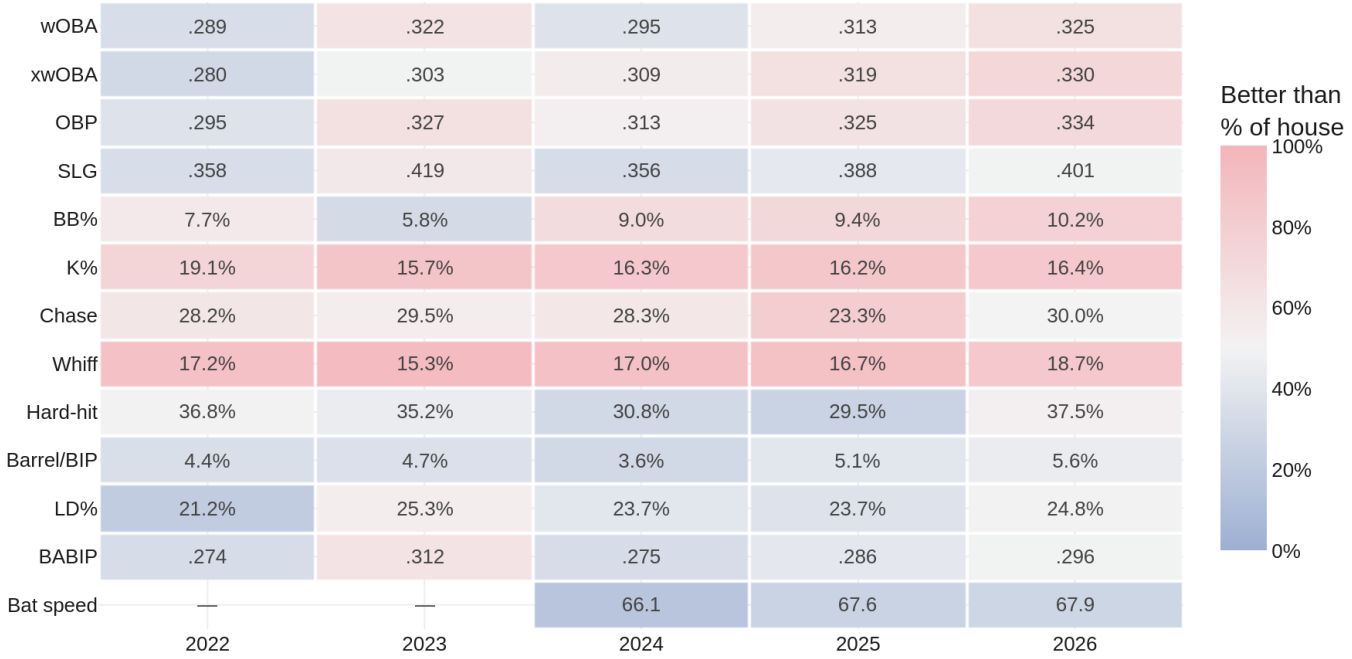

Shaded: your summer era (June-August). Lines start at 25 PA; endpoints reconcile to the house season line (CM-1, tol 1e-9). Regular season only.

Receipts: out/dp_uc55_cum_woba.csv, out/dp_uc55_cum_ops.csv, out/dp_uc55_cum_checkpoints.csv · claim asserted before render

xwOBA rose in every season: .280 → .303 → .309 → .319 → .330

His five seasons on the house KPI panel. Cell colour = share of 220 Phillies hitter-seasons (2015-2026, ≥50 PA) he beat; red = better, blue = worse, so low K%, chase and whiff colour red. 2026 is his best wOBA, xwOBA, OBP, walk rate, hard-hit and barrel season, and his worst chase season. Bat speed ships from 2024.

Receipts: out/dp_uc55_season_card.csv · claim asserted before render

2026	PA	AVG	OBP	SLG	wOBA	xwOBA	BB%	K%	Chase
Mar	13	.250	.308	.250	.259	.322	7.7%	15.4%	48.3%
Apr	82	.200	.250	.280	.238	.285	4.9%	19.5%	32.7%
May	104	.227	.269	.474	.317	.314	5.8%	14.4%	30.6%
Jun	107	.287	.374	.415	.351	.356	11.2%	18.7%	32.5%
Jul	96	.287	.344	.460	.347	.314	8.3%	22.9%	33.8%
Aug	116	.284	.409	.411	.370	.363	17.2%	12.1%	24.0%
Sep	90	.237	.337	.355	.312	.331	12.2%	12.2%	26.9%

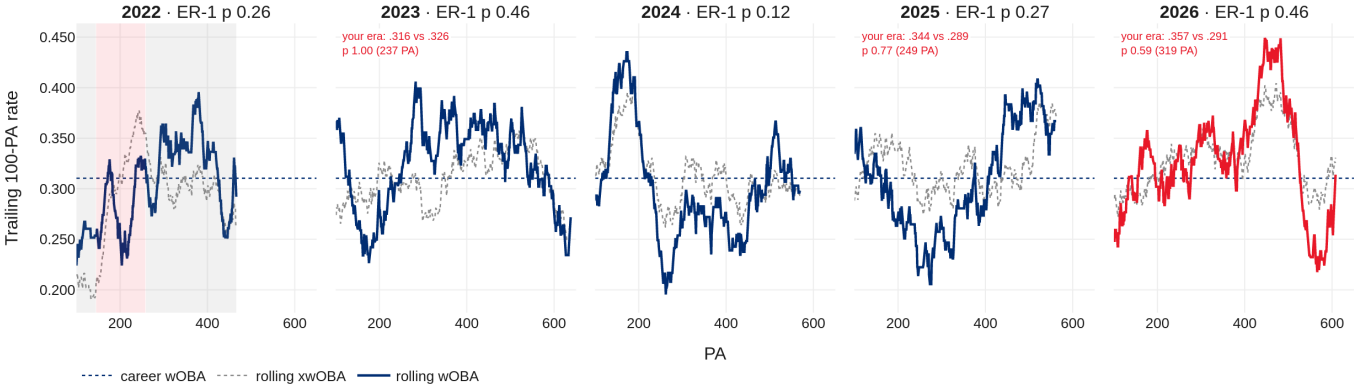

March is 13 PA; every month is under 120 PA. Read the run of months, not any one.

3 · What "Good" looks like: the timeframe question (Q2)

You asked for a better way to set the timeframes. ER-1 is that tool. It splits a season only where the PA-by-PA wOBA changes more than shuffling the same plate appearances would produce: at least 100 PA per era, 500 shuffles, α .10. **No season splits on wOBA.** First-split p values run 0.12 to 0.46. The tool has limited power: it catches a .080-wOBA step half the time and a .120 step 79% of the time. So the honest answer is that his hot and cold stretches are ordinary variance around a level that rises season by season. On xwOBA only his rookie 2022 splits (a .375 middle stretch between weaker starts and finishes). Your eras, scored against the same hindsight-corrected null, don't clear it. They also aren't one thing: early 2023 was a BABIP run (BABIP .330, ISO .113 vs .154 the rest of the year). 2025's second half was a power change (ISO .096 → .182, BABIP flat). Summer 2026 was walks plus BABIP. The cell in `out/dp_uc55_er1_notebook_cell.md` drops ER-1 into your notebook in place of `hot_or_not`.

No season splits into eras: his hot stretches sit inside the noise

Trailing 100-PA wOBA (line) and xwOBA (dotted) within each season; navy dotted = career wOBA .310. ER-1 tests every season for a real change point (500 order permutations, ≥100 PA per era, α .10): none survives on wOBA. The test catches a .080 step half the time (50%) and a .120 step 79% of the time. Your hand-set eras, scored against the same hindsight-corrected null, clear it in no season. On xwOBA only 2022 splits (shaded: red = above career).

Receipts: out/dp_uc55_rolling_100pa.csv, out/dp_uc55_er1_segments_woba.csv, out/dp_uc55_er1_segments_xwoba.csv, out/dp_uc55_er1_tests_woba.csv, out/dp_uc55_er1_power_woba.csv, out/dp_uc55_client_split_woba.csv · claim asserted before render

Your era	Good PA	wOBA Good / rest	xwOBA Good / rest	BA Good / rest	BABIP Good / rest	ISO Good / rest	p (hindsight-corrected)
Mar-May 2023	237	.316 / .326	.296 / .307	.290 / .275	.330 / .301	.113 / .154	1.00
Jul-Sep 2025	249	.344 / .289	.331 / .309	.273 / .241	.289 / .284	.182 / .096	0.77
Jun-Aug 2026	319	.357 / .291	.346 / .312	.286 / .223	.346 / .245	.141 / .150	0.59

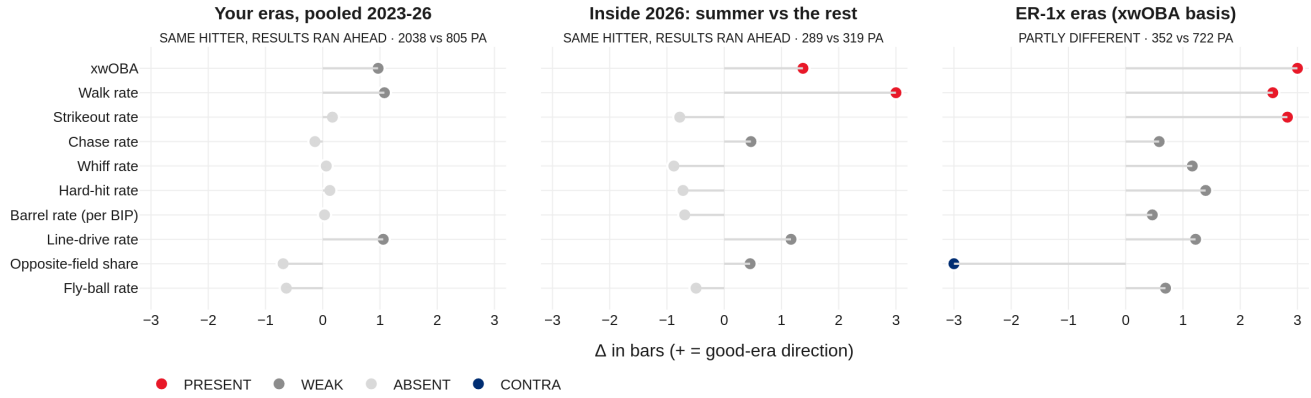

p = share of 500 order-shuffled seasons whose best possible split beats your split. It corrects for having picked the window after seeing the season.

4 · The A/B test, done properly (Q3)

GS-1 was pre-registered in the BID: ten process signatures with a bar each, scored Good minus Bad. Pooled over your three eras (805 vs 2038 PA), 0 of 10 clear. The call is **SAME HITTER, RESULTS RAN AHEAD**, which is your read. Inside 2026, summer cleared on xwOBA and walk rate (both PRESENT). On the xwOBA-detected eras (ER-1x) the call is PARTLY DIFFERENT: walks, strikeouts and xwOBA move, and the opposite-field share goes the wrong way. Whole-season 2026 against 2022-25 reads the same way (PARTLY DIFFERENT). The gain is contact quality with more pull, not more oppo.

Your read holds: in his good eras he was the same hitter, with one exception in summer 2026

GS-1, pre-registered in the BID: ten process signatures, Good minus Bad, each in units of its bar (shaded = cleared the bar; PRESENT also needs p < .05). Pooled across your three eras nothing clears. Inside 2026, summer cleared on xwOBA and walk rate. On the xwOBA-detected eras the walks and strikeouts move, but the opposite-field share goes the wrong way. Results (wOBA, BA, BABIP) are reported, never scored: the eras were chosen on them.

Receipts: out/dp_uc55_gs1_ledger.csv, out/dp_uc55_era_metrics.csv · claim asserted before render

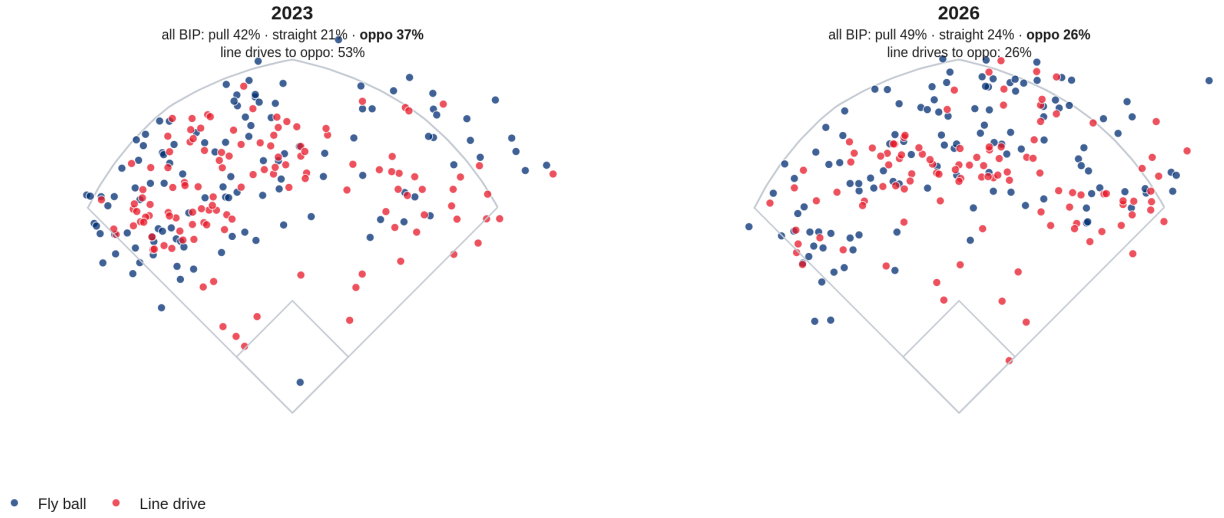

Sig	Signature (bar)	Your eras: Bad → Good	verdict	Summer 2026: rest → summer	verdict
S1	xwOBA (0.025)	.302 → .327	WEAK	.312 → .346	PRESENT
S2	Walk rate (0.015)	7.9% → 9.6%	WEAK	7.6% → 12.5%	PRESENT
S3	Strikeout rate (0.030)	16.8% → 16.3%	ABSENT	15.2% → 17.6%	ABSENT
S4	Chase rate (0.030)	27.8% → 28.3%	ABSENT	30.8% → 29.4%	WEAK
S5	Whiff rate (0.030)	17.0% → 16.8%	ABSENT	17.3% → 19.9%	ABSENT
S6	Hard-hit rate (0.040)	33.8% → 34.3%	ABSENT	38.9% → 36.0%	ABSENT
S7	Barrel rate (per BIP) (0.020)	4.7% → 4.7%	ABSENT	6.3% → 5.0%	ABSENT
S8	Line-drive rate (0.030)	23.0% → 26.2%	WEAK	23.1% → 26.6%	WEAK
S9	Opposite-field share (0.030)	35.2% → 33.2%	ABSENT	25.8% → 27.1%	WEAK
S10	Fly-ball rate (0.030)	26.2% → 24.3%	ABSENT	27.6% → 26.1%	ABSENT

5 · All fields? Line drives or fly balls? The bat path (Q4, Q5)

Not all fields. His opposite-field share fell every season (39% · 37% · 36% · 35% · 26%) and his pull share hit a career high in 2026 (49%). His 2023 line drives went the other way 53% of the time, 2026's 26%. **Line drives, not fly balls:** his line-drive rate was 24.8% (2nd-best of his seasons); fly balls didn't move in his good eras. The bat path shows why. Through the 2025 halves and into 2026 his contact point moved 25.7 → 29.3 → 31.8 in in front of his body (3rd of 12 Phillies in 2026). His swing direction turned from -4.9° to -1.1° (pull +), and his attack angle rose 6.9° → 9.3° (ideal-range swings 49% → 54%). Your attack-direction probe, governed: the middle 65% of swings runs -18° to +17° (raw sign). Inside it his balls in play were hard-hit 35% of the time, outside it 23%.

Not the other way: in his best season he pulled more (49%) and went oppo less (26%) than ever

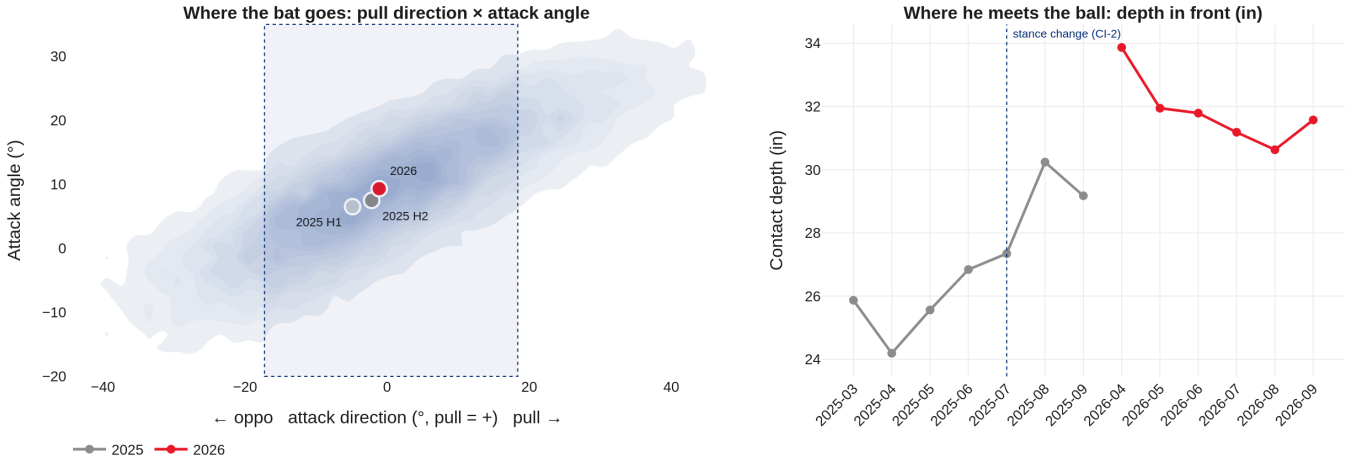

Air balls on a drawn CBP outline (house DR-1 direction boundaries). Opposite-field share of all balls in play by season: 2022 39% · 2023 37% · 2024 36% · 2025 35% · 2026 26%. His 2023 line drives went the other way 53% of the time; 2026's 26%. He bats left, so pull = right field.

Receipts: out/dp_uc55_spray_bip.csv, out/dp_uc55_direction_shares.csv · claim asserted before render

After the 2025 stance change he met the ball further out front (25.7 → 29.3 → 31.8 in) and the swing turned toward the pull side

Left: your attack-angle × attack-direction scatter, rebuilt. Blue cloud = 44,385 tracked Phillies-game swings 2025-26; dotted box = the middle 65% (-18° to +17° raw; this data plane stores attack_direction PULL-NEGATIVE (O-15), so it is flipped here so pull reads right). Right: contact depth by month (≥25 tracked swings); the climb began in June 2025, before the break, and 2026 opened furthest out front. In 2026 that depth ranked 3rd of 12 Phillies hitters. Bat path ships from 2025.

Receipts: out/dp_uc55_bat_path_population_density.csv, out/dp_uc55_bat_path_2025_halves.csv, out/dp_uc55_bat_path_by_year.csv, out/dp_uc55_bat_path_by_month.csv, out/dp_uc55_bat_path_peers.csv · claim asserted before render

Window	Tracked swings	Contact depth (in)	Swing direction (pull +)	Attack angle	Ideal-angle swings	Bat speed	Swing length
2025 H1	597	25.7	-4.9°	6.5°	47%	67.7	7.16
2025 H2	377	29.3	-2.2°	7.5°	53%	68.5	7.06
2026 rest	465	32.5	-0.0°	10.2°	58%	68.5	7.18
2026 summer	554	31.2	-2.0°	8.6°	50%	68.0	7.15

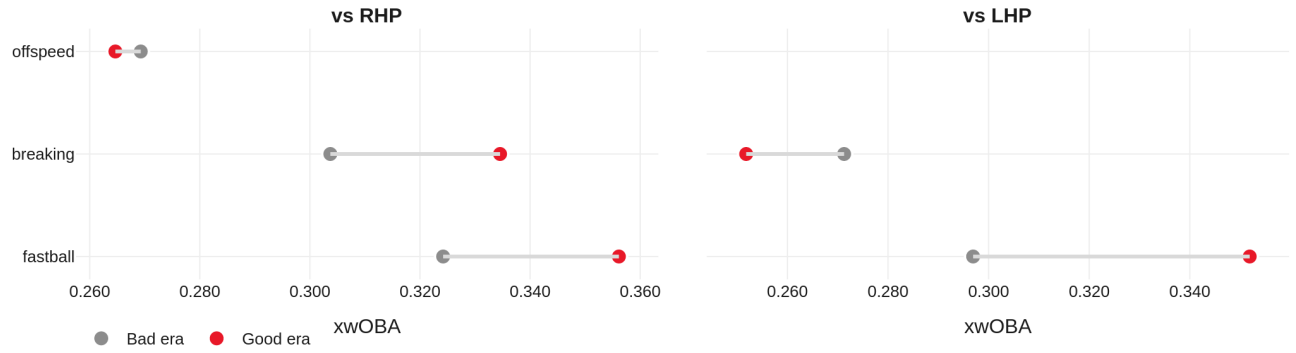

Swing-path tilt is not compared year over year: it fell -1.2° for the median Phillies hitter 2025 → 2026 (O-16); his moved -1.7°.

6 · Lefties, righties, pitch types, velocity (Q6)

Both hands, fastballs. In good eras his xwOBA rose against righties (.308 → .332) and lefties (.285 → .312, 207 PA). The gain sits in fastballs from both hands; offspeed from righties and breaking balls from lefties didn't improve. In 2026 he hit lefties as well as righties (.327 vs .325 wOBA, 145 PA vs LHP), a reversal of 2025 (.259). **Not velocity:** he whiffed on 95+ just as often in good eras (17.8% vs 18.4%, p 0.81).

Good eras were fastball eras: more damage on heaters from both hands, nothing extra against lefty spin or righty changeups

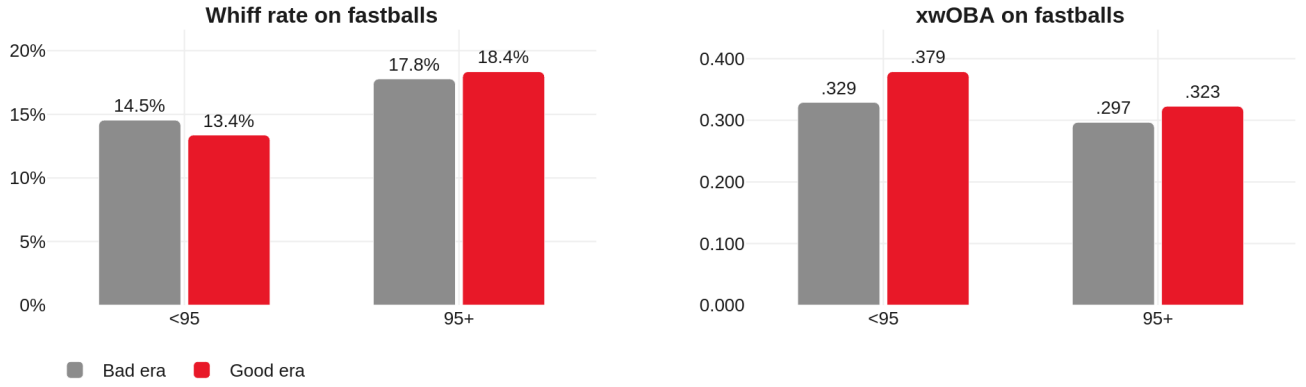

xwOBA by pitch group and pitcher hand, your Bad era (gray) vs Good era (red), 2022-26 regular season, cells ≥25 PA. Fastball xwOBA rose +0.032 vs RHP and +0.055 vs LHP. vs RHP .308 → .332 (598 Good PA); vs LHP .285 → .312 (207 Good PA, small). Hover for whiff and chase.

Receipts: out/dp_uc55_hand_group_era.csv, out/dp_uc55_platoon_by_era.csv · claim asserted before render

Not velocity: he missed 95+ just as often in good eras and gained the same on slower fastballs

Fastballs split at your 94.9 mph cut. Whiff on 95+: 17.8% vs 18.4% (two-proportion p 0.81). xwOBA rose by about the same amount on 95+ and on slower fastballs.

Receipts: out/dp_uc55_velocity_by_era.csv, out/dp_uc55_velocity_by_year.csv · claim asserted before render

Season	vs	PA	wOBA	xwOBA	K%	Chase
2024	LHP	129	.274	.298	20.2%	23.0%
2024	RHP	440	.301	.312	15.2%	29.8%
2025	LHP	123	.259	.281	17.9%	21.1%
2025	RHP	439	.329	.329	15.7%	23.9%
2026	LHP	145	.327	.309	16.6%	27.6%
2026	RHP	463	.325	.336	16.4%	30.8%

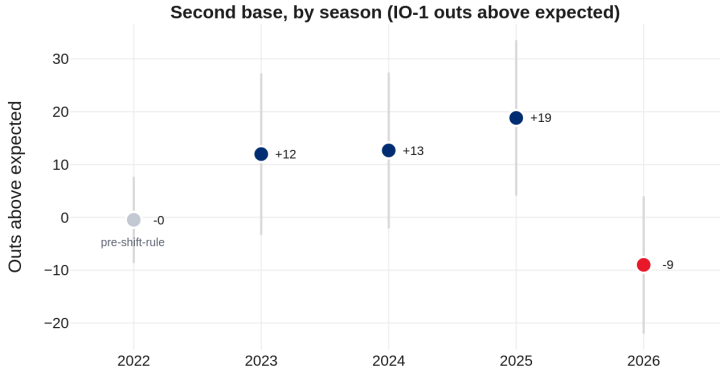

Every LHP row is under 150 PA: directional.

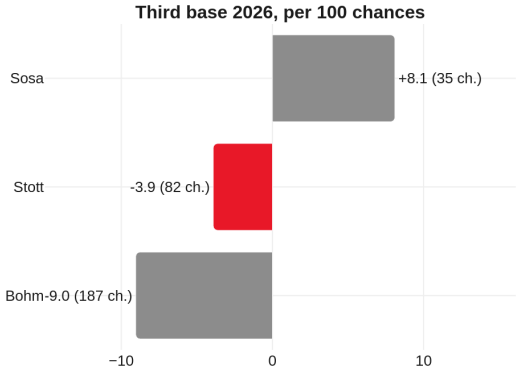

7 · Second base, third base, and the thump question (Q8)

IO-1 scores every ground ball in a position's sector against grounders with similar exit velocity, launch angle and direction fielded by anyone else in Phillies games since the 2023 shift rules. At second base he was +12, +13 and +19 outs above expected in 2023-25, then **-9 in 2026** (280 chances). The sign holds across all four neighbourhood widths. That agrees with the −9 DRS carry-in and disagrees with the +8 OAA. At third base he was -3.2 on 82 chances: better than Bohm's 2026 there (-9.0 per 100 vs his -3.9), with a sign that flips with the neighbourhood width. That isn't enough to call a full-time move, and Dombrowski has said it isn't the plan (CI-3). **The thump:** Stott to third means Arraez at second instead of Bohm's bat at third. In 2026 Arraez hit 2 HR in 192 Phillies PA (ISO .090, barrels 2.3%). Bohm hit 15 HR (ISO .133). The median 2026 Phillies hitter (≥50 PA, n 16) had an ISO of .134.

Second base was a down year by the proxy (-9 after +12, +13, +19); third base is a small, unsettled sample

IO-1 (PROXY): ground balls in each position's sector, outs made vs the out share of similar grounders (EV, LA, direction) fielded by anyone else in Phillies games 2023-26; bars ±1.96 SE. Published carry-ins, never blended: 2026 2B +8 OAA / −9 DRS (953⅓ inn); 3B +2 OAA / +3 DRS in his first 129 inn. The 3B sign is not stable across neighbourhood widths (82 chances).

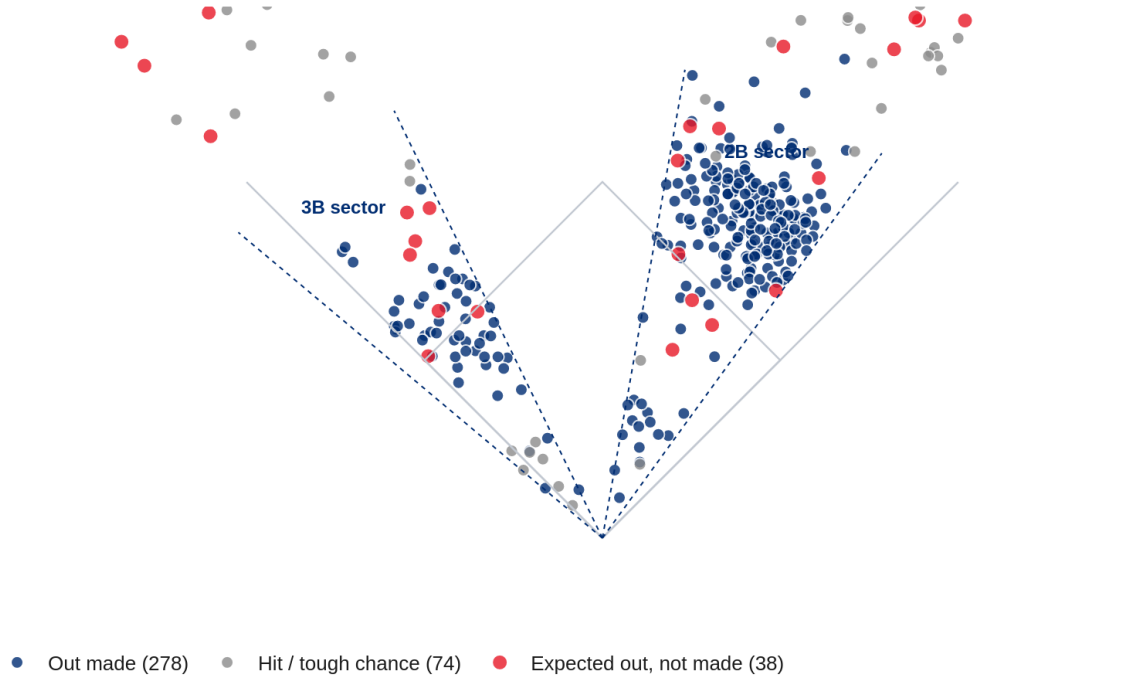

Receipts: out/dp_uc55_io1_summary.csv, out/dp_uc55_io1_phillies_context.csv, out/dp_uc55_io1_sensitivity.csv · claim asserted before render

2026: 38 likely outs (≥70% expected) were not converted

Every scored and unscored IO-1 opportunity in 2026 at 2B (280 scored) and 3B (82 scored), at the spot the ball was fielded or stopped. Red = expected-out probability ≥ 70% and no out. The log has no starting positions, arm or range data: read the reds as plays to watch on video.

Receipts: out/dp_uc55_io1_opportunities.csv · claim asserted before render

Position	Season	Chances scored	Outs	Expected	IO-1 outs above expected	Per 100	Coverage
2B	2022 (pre-rule)	113	86	86.5	-0.5	-0.4	94%
2B	2023	389	306	294.0	+12.0	+3.1	95%
2B	2024	342	265	252.3	+12.7	+3.7	96%
2B	2025	333	262	243.2	+18.8	+5.7	95%
2B	2026	280	203	212.0	-9.0	-3.2	93%
3B	2022 (pre-rule)	8	5	5.3	-0.3	-4.3	100%
3B	2026	82	54	57.2	-3.2	-3.9	92%

Carry-ins beside, never blended: 2026 2B +8 OAA / −9 DRS (953⅓ inn); 3B +2 OAA / +3 DRS (first 129 inn); career 2B +33 OAA / +8 DRS.

2026, Phillies PA	PA	HR	ISO	SLG	Barrel/BIP	xwOBA	wOBA
Sosa, Edmundo	250	9	.182	.429	7.2%	.330	.307
Stott, Bryson	608	10	.146	.401	5.6%	.330	.325
Bohm, Alec	632	15	.133	.381	6.0%	.327	.307
Arraez, Luis	192	2	.090	.367	2.3%	.315	.295

Arraez's Phillies PA start 2026-08-04; Stott's first game at third was 2026-08-04.

8 · Your notebook, graded

Each claim is reproduced on your own frame with your own functions, then restated on the governed frame. The receipts are `out/dp_uc55_hp_*.csv`.

#	Your claim	Your frame	Governed	Grade

HP-03	'Walked more than ever this year'	9.7%	10.2% (62 BB), best of his 5 seasons	**REPRODUCED**
HP-04	'Pretty consistent K rate'	19.3% / 16.5% / 16.7% / 16.5% / 16.9%	19.1% / 15.7% / 16.3% / 16.2% / 16.4%	**SUPPORTED**
HP-05	'Line drives up to 2023 levels'	24.9% vs 25.6%	24.8% vs 25.3%	**SUPPORTED**
HP-06	'Chased more than ever'	30.4%	30.0%, worst of his 5 seasons	**SUPPORTED**
HP-07	Good vs Bad: 'pretty much the same hitter'	(A/B by eye)	GS-1 on your eras: SAME HITTER, RESULTS RAN AHEAD	**SUPPORTED**
HP-08	Platoon: no noticeable Good/Bad difference by hand	wOBA vs L .293 -> .325; vs R .296 -> .339	xwOBA vs L .285 -> .312; vs R .308 -> .332	**SUPPORTED**
HP-09	'It might be velocity?'	(table)	95+ fastballs: whiff 17.8% vs 18.4% (p 0.81)	**NOT SUPPORTED**
HP-10	Attack-direction 'middle 65%' = -18 to +13	-18.6 to +17.3 (client frame quantiles)	-18.4 to +17.3 (BP-0 tracked swings, 44,385)	**PARTLY**
HP-11	2B 2026 'might have been a down year'	(no code)	IO-1 -9.0 outs vs +18.8 (2025)	**SUPPORTED**
HP-12	3B 'good enough ... to potentially move there full time'	(no code)	IO-1 3B -3.2 on 82 opps; Bohm -16.9	**OPEN**
HP-13	'This team has limited thump if so'	(no code)	ISO Arraez .090 vs Bohm .133	**SUPPORTED**
HP-14	Thesis: 'I don't believe' there is another level	-	xwOBA rose every season (.280 -> .303 -> .309 -> .319 -> .330)	**PARTLY**

Three things for 2027

1. **Keep the contact point.** 31.8 in out front is the change behind the career-best contact. It held all season; protect it in the off-season work.
2. **Take back the zone.** Chase 30.0% → his 2025 level (23.3%) is the cheapest +OBP on the table. August (24.0% chase, 17.2% walks) is the proof of concept inside this season.
3. **Stop chasing the eras.** Judge 2027 by season-level xwOBA and the ER-1 test, not by hot months; his good stretches have been variance around a rising line.

Candid caveats

- ER-1 has limited power at one season of PA. "No split" means no change large enough to separate from variance, not proof that nothing changed.
- GS-1 eras were chosen on results, so results are reported and never scored. Process signatures are the test.
- Bat-path metrics exist for 2025-26 only. The 2025 stance change is a dated carry-in. The depth climb began in June 2025, before the break, and no causal claim is made.
- IO-1 is a proxy: no starting positions, range, arm or hang time. The pool was widened (A-1) and the neighbourhood loosened (A-2) after coverage gates failed; both are disclosed in 03 §2. Third base is 2026-only and small.
- The house hitter pool is Phillies hitter-seasons (2015-26, ≥50 PA), not MLB.
- Inherited exposures: 4 untracked balls in play count as not hard-hit (O-8); truncated PA count as PA (TP-1, 05 §1).
