

Trea Turner 2026 — What Each Person Can Do

dp_uc24 · uc-pos-006 · through 2026-07-20 · The bat is down (first below-average season by wRAA), but it's a shape-and-decision problem, not a lost engine — and July is trending back. Each action traces to an indicator; small samples flagged in the full report.

THE HITTER	THE FIXES	THE CALL
Get back to pulling the ball in the air. Pull .352 / pulled-air .117 — Phillies-era lows, lowest since 2020 (was .14-.17). Attack the hittable strike earlier. In-zone swing fell to .692; first-pitch swing .330 — deeper into counts than his norm. Hunt the inner-half fastball you still crush. Fastball .352 wOBA — the one pitch group still working; oppo rate a career-high .326.	Close the offspeed hole. .184 wOBA, 37.8% K, .407 chase vs offspeed — new and severe; recognition / two-strike plan. Investigate the vanished LHP edge. .632 OPS vs LHP (144 PA), from .884 / .833 in '24-'25 — uncharacteristic, still early. Protect the July gains. Watch pulled-air and line-drive rate — the leading indicators — not batting average.	Bank the July form; keep his spot. Trailing-100-PA OPS climbed .455 → .973; the process is reattaching. Don't build on the post-break cameo. 3 games / 14 PA (2.143 OPS) — directional only; no plan rests on it. Rest day if the soft top-end EV is fatigue. 90th-pct EV 103.5 — a career low; cheap insurance in the dog days.
